Amendments to the Claims:

This listing of claims will replace all prior versions and listings of claims in the application:

Listing of Claims:

1. (Currently Amended) A device for deliberate, controllable delivery or drawing of a lubricant, comprising:

a) a cylindrical reservoir having a piston dividing the reservoir into a storage chamber for the lubricant and a pressure chamber for hydrogen gas, wherein the piston is positioned with the cylindrical reservoir to be moveable longitudinally within the cylindrical reservoir;

b) the storage chamber for the lubricant leading into a discharge opening in the reservoir for the lubricant;

c) an insert in the pressure chamber, which insert contains at least one hydrogen gas generating cell and a circuit for the running-time control; and

d) at least a portion of a wall of the cylindrical reservoir having three layers, wherein at least two of the three layers comprise different chemical substances and wherein all three layers are transparent;

e) the three layers including an inner layer~~,~~ comprising transparent polyethylene terephthalate, a central layer~~,~~ comprising polyamide, and an outer layer comprising transparent polyethylene terephthalate, such that the central layer has a lower diffusion coefficient for the hydrogen gas ~~to be~~ generated by the at least one hydrogen gas generating cell than the diffusion coefficient of the inner and outer layers; and

f) wherein the central layer has a thickness of 30-60% of the entire wall and the device operates at counterpressures of over 5 bar.

2. (Cancelled)

3. (Previously Presented) A device, according to Claim 1, wherein the center layer consists of one of a solid material and of a liquid which is transparent.

4. (Previously Presented) A device, according to Claim 1, including a detachable closing device molded to the discharge opening.

5-8. (Cancelled)

9. (Previously Presented) A device, according to Claim 1, wherein the center layer has a thickness of 40-50% of the entire wall.

10. (Previously Presented) A device, according to Claim 1, wherein the center layer has a thickness of 45% of the entire wall.

11. (Previously Presented) A device, according to Claim 4, wherein there are breaking points between the closing device and the discharge opening.

12. (Previously Presented) A device, according to Claim 11, wherein the breaking points are notches.

13-20. (Cancelled)

21. (New) A device according to Claim 1, wherein the portion of the wall of the cylindrical reservoir having three layers is produced by coinjection.

22. (New) A device according to Claim 1, wherein the portion of the wall of the cylindrical reservoir having three layers is produced by multi-material molding.
